

Task 03: AI & Testing — Reflection Questions

1. In your opinion, how do you think AI will impact software testing over the next 2–3 years?

Answer: I think there will be an impact definitely but mostly on automation. For manual testing, company will heavily rely on testers more than on AI. I personally take AI's help and it has increased my productivity but as a QA my job is to find what will be a software supposed to feel like for the end user and for that I don't think AI can help because at the end of the day whatever software/app we are building it is for human use and AI can't help with that. Maybe AI will be heavily used using agentic coding but there will be always need for QA.

Also, I think over the next 2-3 years AI will get more expensive and it will be out of hand because of the pricing aspect haha.

2. Do you personally use AI? Does AI help you in testing? If yes, in what specific ways does it help?

Answer: Yes, I personally use AI. I use AI to understand the overall task, the requirements as I have started my career recently as a QA.

3. Which AI tools do you currently use (for testing or otherwise)?

Answer: I mostly use ChatGPT for learning, documentation and testing related tasks.

4. Which AI tool do you currently find most helpful for testing specifically, and why do you think that is?

Answer: For me it is ChatGPT because it is a bit reasonable. And it also quickly generates the requirements, explain errors. But sometimes it does not understand my commands. Claude is a bit expensive for me.
